Overview of Penaeid Culture in the Americas

Gilberto J. Escobar
COSEMAR C.A.
P.O. Box 1230, Guayaquil, Ecuador

Abstract The paper discusses the reasons behind the farming success of Ecuador, as well as the limitations associated with farming throughout the rest of the Americas. Emphasis is given to specific farming practices, management techniques, and physical design characteristics. Through improved techniques the farmer is approaching the point where he can reliably manage his crop size and harvest time as dictated by market trends and postlarval supply.

Until recently, pond production has been characterized by relatively small-scale operations often experimental in origin. Due to the farming success in one country, production output has risen from 4,800 tons in 1978 to 23,390 tons in 1983. As evidenced by this dramatic rise in production, Ecuador is in a period of expansion and increasing technical awareness, the combined results of which have led it to become the production leader in pond-grown shrimp.

The economic pull towards Ecuador is now slowly giving way to shrimp development in other parts of the Americas. Owning to the technical gains brought about by government programs, universities and private industries, shrimp farming has become a potential activity in many areas previously thought inadequate. Production methods have progressed from the traditional extensive method to sophisticated closed system raceways. All but the latter method are exemplified by the techniques used throughout Ecuador.

Presently, Ecuador has in production 50,000 ha of ponds. Of these, 30,000 ha are farmed using the extensive method characterized by low cost and low output. The successful approach referred to as the semi-extensive method occupies approximately 15,000 ha. This style of farming, while requiring increased cost, leads to a proportionately higher production output. The third approach is the semi-intensive method under which an estimated 5,000 ha are in production. Increasingly higher production rates are being achieved through improvements in physical pond design, pond maintenance and preparation, feeding and fertilization regimes, technical management, and control.

Introduction

There are four major shrimp farming areas in the Americas: 1) North America — U.S.A. (Hawaii, Texas, North and South Carolina) and Mexico; 2) Caribbean — Antigua, Bahamas, Cuba, Dominica, Dominican Republic, Grenada, Guadaloupe, Jamaica, Martinique, Puerto Rico and U.S. Virgin Islands; 3) Central America — Belize, Costa Rica, Guatemala, Honduras and Panama; and 4) South America — Brazil, Ecuador and Peru.

Shrimp culture in Latin America

Latin America (Central and South America) has recently become the world leader in shrimp farming. Among the several countries presently involved, Ecuador and Panama have developed the techniques now used in extensive marine shrimp culture. The viability of natural resources all year round, low wages, inexpensive coastal areas suited for farming, cheap fuel, adequate climate, and plenty of wild postlarvae from the estuaries have all contributed to the expansion

of farming in these countries. What were accidental observations early in the sixties have grown to a multi-million dollar industry.

The introduction of technology and management has improved the yield, reliability and profitability of the farms into sophisticated operations which involve careful planning

and execution of the several phases of production. From simple farming the process has grown to include hatcheries, nurseries, grow-out, feeding, fertilizing, harvesting, processing and exporting. The coordination of all phases has to be accomplished for the successful production of shrimp.

The outstanding quality of farmed shrimp is slowly being recognized in the most demanding markets. It is principally achieved due to freshness in processing, considerably less handling compared to common boat operations, and constant year-round supply. Farming is becoming a serious threat to boat operators who will be forced to reduce the number of boats to improve their catch per boat, and to stay in step with the rising cost of energy and the lowering of prices for shrimp.

The involvement of different countries can be individually observed in Tables 1-4 which summarize some of the information.

**Ecuador**

Ecuador has three major production areas:

1. Machala (south) — Where shrimp farming originated; has maintained its tradition of extensive, low-yield production.

2. Bahia (north in Manabi Province) — Second area where shrimp farming developed very rapidly with the introduction of some technology and farm rationalization.

3. Guayas (central near Guayaquil) — Largest of all three areas and also has largest potential. Mixed results when technology was copied from other two areas. Better results from large farms where advanced technology in design, construction and management has been applied with very good results.

The reasons for the successful farming experience in Ecuador may be traced to ecology, agriculture, politics and economics. Ecology has been the most important factor, providing postlarvae of the species *P. vannamei* and *P. stylirostris* year-round, salinity between 6 and 33 ppt, temperature between 23 and 32°C, and sufficient land with high clay content and pH of 8.

Ecuador is a country of agricultural workers forced out of agriculture due to land reform implementation and political prices for its products. It was easy to convert the equipment and workers from agriculture to a similar activity — aquaculture — with limited skill required.

Politically, poor government management of the oil resources produced inflation and an economic crisis which practically stopped commerce, housing construction and industry, on top of the semi-paralyzed agricultural activities. People who wanted to work and produce legally had no other choice but to start a shrimp farm taking advantage of a non-labor intensive operation, with some financing available.

Last but not the least factor was profitability due to good shrimp prices and good revenues in dollars which was the kind of money everybody wanted.

**Future of shrimp in the Americas**

There will be individual problems in each country (Table 5) but, on the whole, shrimp culture will grow very fast due to the following factors:

1. Development of hatcheries and technology
2. Strong dollar-oriented activity and belief in its profitability
3. Non-labor intensive
4. Techniques which can be easily copied
5. Availability of coastal land in areas not suitable for agriculture.
